PASSWORD MANAGER > BITWARDEN SEND

Send Privacy

Send Privacy

Protect the contents of your Send by configuring a password for access so unintended recipients can't see the information, and/or to hide your email from recipients. For text Sends, you can also optionally require recipients to toggle visibility to prevent exposure to unintentional onlookers.

The **Password**, **Hide Email**, and **Hide Text** options can be set while creating a new Send, or from the **Edit Send** view at any time prior to the Send's deletion.

Send passwords

For any Send, you can set a password that recipients will be required to enter in order to access it. Password-protecting a Send is a good way to ensure the information in it is not exposed to unintended recipients:

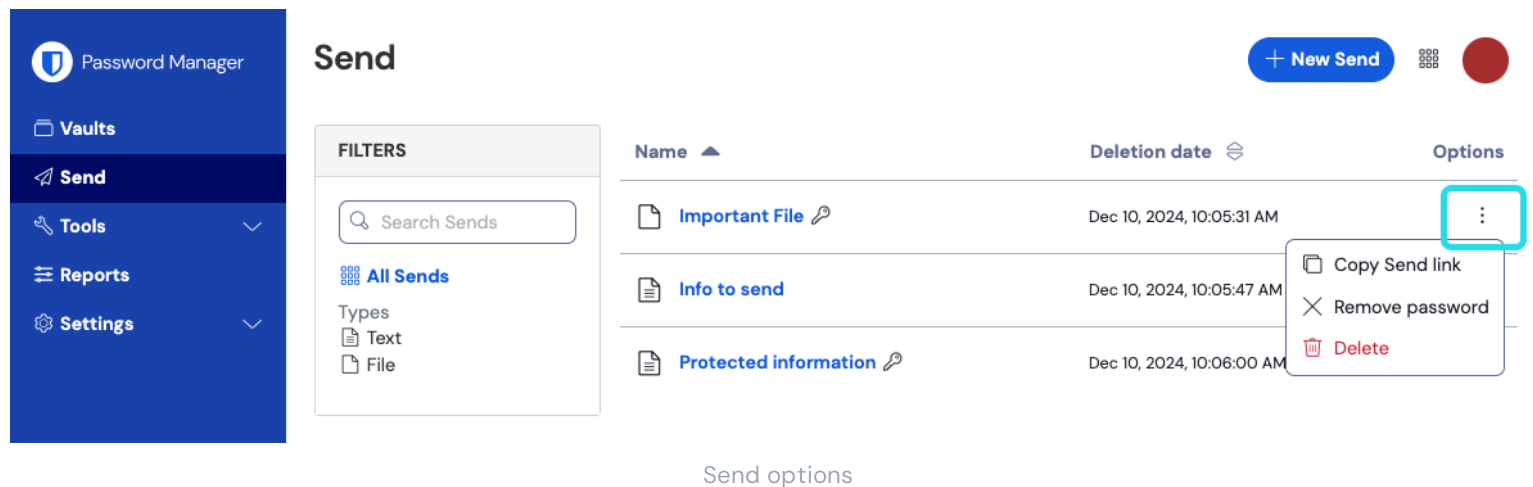

Receiving a password-protected Send

Once you password-protect a Send, you won't be able to view the configured password again, however you can change or remove it at any time.

Change Send passwords

You can change a Send's password at any time from the **Edit Send** view. Changing a Send's password will not require you to enter the previous password. When changing a Send's password, the **Password** field will change to **New Password.**

Remove Send passwords

You can remove a Send's password at any time using the ↺ **Remove Password** menu option. Removing a Send's password will not require you to enter the previous password:

Send options

Hide email

> 💡 **Tip**
>
> For enterprise organizations, the availability of this option can be set using an enterprise policy.

By default, Sends will display the email address of the sender to recipients.

Hidden-email text Send

Toggle the **Hide my email address from recipients** option to remove your email address from the Send. Recipients can still validate the trustworthiness of expected Sends by cross-referencing the **Send link** with their sender. Hidden-email send objects will issue a warning to recipients encouraging them to do so:

Hide text

For text Sends, toggle the **When accessing the Send, hide the text by default** option to require recipients to 👁 **Toggle Visibility** in order to see its contents. Hiding the text is a good way to ensure the information in it is not exposed to unintentional onlookers:

Receiving a hidden–text Send
